Assignment 7: Time Series Analysis

Azura Liu

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on time series analysis.

Directions

- 1. Change "Student Name" on line 3 (above) with your name.
- 2. Work through the steps, **creating code and output** that fulfill each instruction.
- 3. Be sure to **answer the questions** in this assignment document.
- 4. When you have completed the assignment, **Knit** the text and code into a single PDF file.
- 5. After Knitting, submit the completed exercise (PDF file) to the dropbox in Sakai. Add your last name into the file name (e.g., "Fay_A07_TimeSeries.Rmd") prior to submission.

The completed exercise is due on Monday, March 14 at 7:00 pm.

Set up

##

- 1. Set up your session:
- Check your working directory
- Load the tidyverse, lubridate, zoo, and trend packages
- Set your ggplot theme

```
#1 set up
getwd()
## [1] "C:/Users/Idae/Desktop/ENV872/Environmental_Data_Analytics_2022/Assignments"
#install.packages("zoo", "trend")
library(tidyverse)
## -- Attaching packages ------ tidyverse 1.3.1 --
## v ggplot2 3.3.5
                    v purrr
                             0.3.4
## v tibble 3.1.5
                    v dplyr
                             1.0.7
## v tidyr
           1.1.4
                    v stringr 1.4.0
## v readr
          2.0.2
                    v forcats 0.5.1
## -- Conflicts ----- tidyverse conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()
                  masks stats::lag()
library(lubridate)
## Attaching package: 'lubridate'
## The following objects are masked from 'package:base':
```

2. Import the ten datasets from the Ozone_TimeSeries folder in the Raw data folder. These contain ozone concentrations at Garinger High School in North Carolina from 2010-2019 (the EPA air database only allows downloads for one year at a time). Import these either individually or in bulk and then combine them into a single dataframe named GaringerOzone of 3589 observation and 20 variables.

```
#2 import dataset
air2010 <- read.csv('../Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2010_raw.csv')
air2011 <- read.csv('../Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2011_raw.csv')
air2012 <- read.csv('../Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2012_raw.csv')
air2013 <- read.csv('../Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2013_raw.csv')
air2014 <- read.csv('../Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2014_raw.csv')
air2015 <- read.csv('../Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2015_raw.csv')
air2016 <- read.csv('../Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2016_raw.csv')
air2017 <- read.csv('../Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2017_raw.csv')
air2018 <- read.csv('../Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2018_raw.csv')
air2019 <- read.csv('../Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2019_raw.csv')</pre>
```

Wrangle

- 3. Set your date column as a date class.
- 4. Wrangle your dataset so that it only contains the columns Date, Daily.Max.8.hour.Ozone.Concentration, and DAILY AQI VALUE.
- 5. Notice there are a few days in each year that are missing ozone concentrations. We want to generate a daily dataset, so we will need to fill in any missing days with NA. Create a new data frame that contains a sequence of dates from 2010-01-01 to 2019-12-31 (hint: as.data.frame(seq())). Call this new data frame Days. Rename the column name in Days to "Date".
- 6. Use a left_join to combine the data frames. Specify the correct order of data frames within this function so that the final dimensions are 3652 rows and 3 columns. Call your combined data frame GaringerOzone.

```
# 3 as.date
class(Ozone$Date)
## [1] "character"
```

```
Ozone$Date <- as.Date(Ozone$Date, "%m/%d/%Y")
class(Ozone$Date)

## [1] "Date"

# 4

Selected_Ozone <- select(Ozone, Date, Daily.Max.8.hour.Ozone.Concentration,DAILY_AQI_VALUE)

# 5
Days <- as.data.frame(seq(as.Date("2010/01/01"),as.Date("2019/12/31"), "days"))
names(Days)[1] <- "Date"

# 6
GaringerOzone <- left_join(Days, Selected_Ozone)

## Joining, by = "Date"

dim(GaringerOzone)

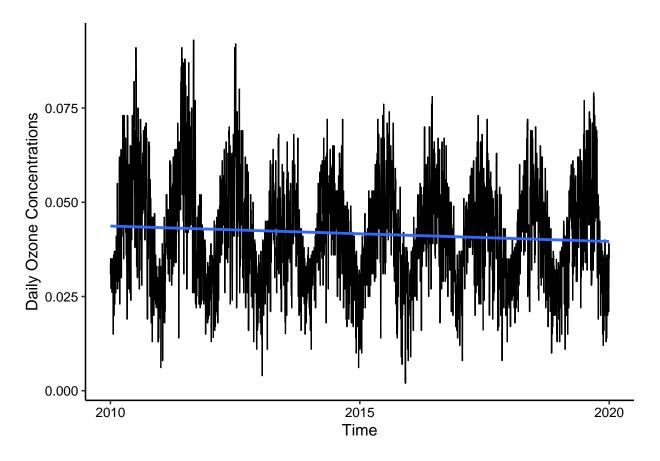

## [1] 3652 3</pre>
```

Visualize

7. Create a line plot depicting ozone concentrations over time. In this case, we will plot actual concentrations in ppm, not AQI values. Format your axes accordingly. Add a smoothed line showing any linear trend of your data. Does your plot suggest a trend in ozone concentration over time?

```
#7
Ozone_Plot<-ggplot(GaringerOzone, aes(x = Date, y = Daily.Max.8.hour.Ozone.Concentration))+
   geom_line() +
   geom_smooth(method = lm, se = FALSE)+
   ylab("Daily Ozone Concentrations") +
   xlab("Time")</pre>
Ozone_Plot
```

```
## `geom_smooth()` using formula 'y ~ x'
## Warning: Removed 63 rows containing non-finite values (stat_smooth).
```

Answer: There appears to be a declining trend in the ozone concentration over time.

Time Series Analysis

Study question: Have ozone concentrations changed over the 2010s at this station?

0.00200 0.03200 0.04100 0.04151 0.05100 0.09300

8. Use a linear interpolation to fill in missing daily data for ozone concentration. Why didn't we use a piecewise constant or spline interpolation?

```
#8
summary(GaringerOzone$Daily.Max.8.hour.Ozone.Concentration)

## Min. 1st Qu. Median Mean 3rd Qu. Max. NA's
## 0.00200 0.03200 0.04100 0.04163 0.05100 0.09300 63

GaringerOzone_filled <-GaringerOzone %>%
mutate(Daily.Max.8.hour.Ozone.Concentration = zoo::na.approx(Daily.Max.8.hour.Ozone.Concentration))

summary(GaringerOzone_filled$Daily.Max.8.hour.Ozone.Concentration) #no NAs now

## Min. 1st Qu. Median Mean 3rd Qu. Max.
```

Answer: The relationship of our interest is linear rather than polynomial, we thus use a linear interpolation.

9. Create a new data frame called GaringerOzone.monthly that contains aggregated data: mean ozone concentrations for each month. In your pipe, you will need to first add columns for year and month to form the groupings. In a separate line of code, create a new Date column with each month-year

combination being set as the first day of the month (this is for graphing purposes only)

```
#9
GaringerOzone.monthly<-GaringerOzone_filled%>%
  mutate(Year = year (Date), Month = month (Date))%>% #new columns
  mutate(Date = as.Date(paste(Year, Month, 1, sep = "-"))) %>%
  group_by(Date) %>%
  summarise(MonthlyOzone = mean(Daily.Max.8.hour.Ozone.Concentration))
head(GaringerOzone.monthly)
```

```
## # A tibble: 6 x 2
##
     Date
                MonthlyOzone
##
     <date>
                        <dbl>
## 1 2010-01-01
                       0.0305
## 2 2010-02-01
                       0.0345
## 3 2010-03-01
                       0.0446
## 4 2010-04-01
                       0.0556
## 5 2010-05-01
                       0.0466
## 6 2010-06-01
                       0.0576
```

10. Generate two time series objects. Name the first GaringerOzone.daily.ts and base it on the dataframe of daily observations. Name the second GaringerOzone.monthly.ts and base it on the monthly average ozone values. Be sure that each specifies the correct start and end dates and the frequency of the time series.

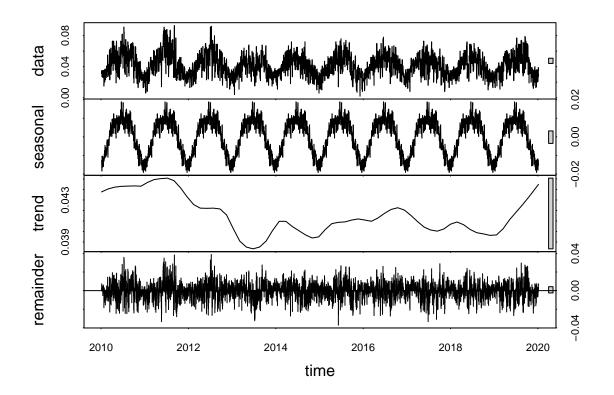

```
#10
```

```
GaringerOzone.daily.ts<-ts(GaringerOzone_filled$Daily.Max.8.hour.Ozone.Concentration, start = c(2010.01 GaringerOzone.monthly.ts<- ts(GaringerOzone.monthly$MonthlyOzone, start = c(2010.01), frequency = 12)
```

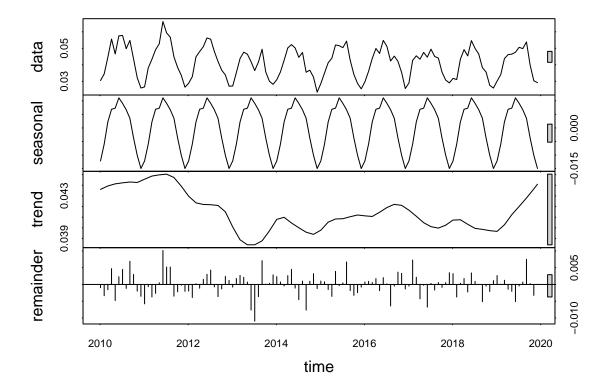

11. Decompose the daily and the monthly time series objects and plot the components using the plot() function.

#11

```
GaringerOzone.daily_Decomposed <- stl(GaringerOzone.daily.ts, s.window = "periodic")
plot(GaringerOzone.daily_Decomposed)</pre>
```

GaringerOzone.monthly_Decomposed <- stl(GaringerOzone.monthly.ts, s.window = "periodic")
plot(GaringerOzone.monthly_Decomposed)</pre>

12. Run a monotonic trend analysis for the monthly Ozone series. In this case the seasonal Mann-Kendall is most appropriate; why is this?

```
#12
#install.packages("Kendall")
library(Kendall)

monthly_trend <- Kendall::SeasonalMannKendall(GaringerOzone.monthly.ts)
summary(monthly_trend)

## Score = -77 , Var(Score) = 1499

## denominator = 539.4972

## tau = -0.143, 2-sided pvalue =0.046724

#p<0.05, there is a trend, negatively related</pre>
```

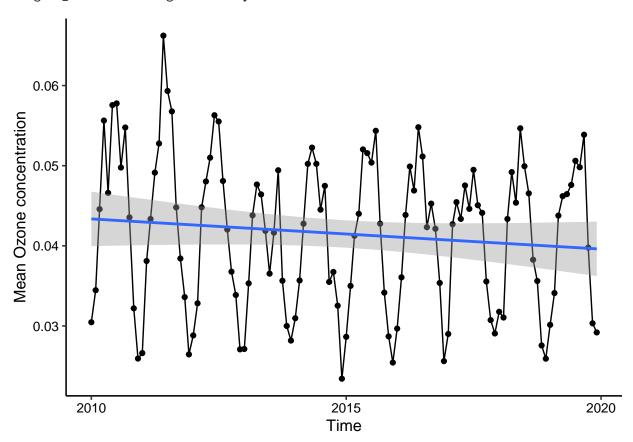

Answer: Seasonal Mann-Kendall is the only trend analysis that accounts for seasonality, and we have a seasonal trend here.

13. Create a plot depicting mean monthly ozone concentrations over time, with both a geom_point and a geom_line layer. Edit your axis labels accordingly.

```
# 13
Monthly_Plot<-
    ggplot(GaringerOzone.monthly, aes(x = Date, y = MonthlyOzone)) +
    geom_point() +
    geom_line() +
    geom_smooth( method = lm ) +
    xlab("Time")+</pre>
```

```
ylab("Mean Ozone concentration")
Monthly_Plot
```

`geom_smooth()` using formula 'y ~ x'

14. To accompany your graph, summarize your results in context of the research question. Include output from the statistical test in parentheses at the end of your sentence. Feel free to use multiple sentences in your interpretation.

Answer: The seasonal Mann-Kendall test returned a significant P value ((tau = -0.143, 2-sided pvalue =0.046724) meaning that we shall reject our null hypothesis where no trend exists in our dataset. The tau value implies a negative correlation where the Ozone concentration decreases over time, as depicted in the graph.

- 15. Subtract the seasonal component from the GaringerOzone.monthly.ts. Hint: Look at how we extracted the series components for the EnoDischarge on the lesson Rmd file.
- 16. Run the Mann Kendall test on the non-seasonal Ozone monthly series. Compare the results with the ones obtained with the Seasonal Mann Kendall on the complete series.

```
#15
Garinger_components <- as.data.frame(GaringerOzone.monthly_Decomposed$time.series[,1:3])
Garinger_components <- mutate(Garinger_components,
Date = GaringerOzone.monthly$Date,
Ozone = GaringerOzone.monthly$MonthlyOzone)
```

```
subtracted<-Garinger_components$0zone-Garinger_components$seasonal
#16
monthly_trend1<-Kendall::MannKendall(subtracted)
summary(monthly_trend1)</pre>
```

```
## Score = -1179 , Var(Score) = 194365.7
## denominator = 7139.5
## tau = -0.165, 2-sided pvalue =0.0075402
```

Answer: The P value is much more smaller for a more significant monotonic trend.
